Report on the

Calculation of the UFR for 2021

Executive summary

EIOPA has calculated ultimate forward rate (UFR) for 2021 in accordance with the methodology to derive the UFR. For the euro, the calculated UFR for 2020 is 3.50%. As the current UFR for the euro is 3.75% and the annual change of the UFR is according to the methodology limited to 15 basis points, the applicable UFR in 2021 is 3.60%. That UFR is for the first time applicable for the calculation of the risk-free interest rates of 1 January 2021¹.

1. Expected real rate

The UFR is the sum of an expected real rate and an expected inflation rate. The expected real rate is the same for all currencies. It is calculated as a simple average of the past real rates since 1961. For the calculation of the expected real rate for 2021, the observed real rate of 2019, which is - 1.32%, newly enters the calculation. The resulting expected real rate is 1.50%. Annex 1 sets out intermediate results of the calculation.

2. Expected inflation rate

The expected inflation rate is currency-specific. It is based on the inflation target of central banks and can take the values 1%, 2%, 3% or 4%.

The expected inflation rate remains unchanged for all currencies. The following table sets out the expected inflation rate per currency. Annexes 2 and 3 set out

¹ Please note that the EC Delegated act published by the Commission on the 8th of March 2019 introduced additional provisions concerning EIOPA's work on the risk-free technical information, including that the technical information shall be modified by EIOPA at the request of the European Commission.

Annex 3 – Derivation of the expected real rate for currencies without inflation target

For currencies without inflation target the expected inflation rate is derived from the past inflation rates and their projection to the future. The following table sets out for the affected currencies the average inflation over the last 10 years and the projected inflation rate in 2053 (in 35 years) according to an ARMA model.

Currency	Average inflation rate over the last 10 years	Projection
Croatian kuna	1.1%	2.2%
Malaysian ringgit	2.2%	2.4%
Hong Kong dollar	3.2%	2.6%
New Taiwan dollar	1.0%	1.6%
Singapore dollar	1.7%	2.4%

According to the UFR methodology, the expected inflation rate for currencies without inflation target is 2%, unless both the 10-year average and the projection clearly indicate that the inflation is expected to be at least one percentage point different from 2%. All currencies therefore fall in the 2% bucket.
